

BATTISA NALLAH MINOR IRRIGATION PROJECT

Justification of locating the project in forest land

It is to certify that the dam site for Battisa Nallah Minor Irrigation Project has been finalized after considering its techno feasibility with regards to availability of good strata for foundation, small gorge length with maximum storage capacity at minimum submergence. From the project site optimum command area is available by gravity system with minimum canal length.

Considering above facts the proposed site is most suitable for construction of gravity dam for minor irrigation project & there is no alternate site available for construction of dam with above parameters on the Battisa Nallah stream.
