JUSTIFICATION FOR LOCATING PROJECT IN FOREST LAND

The project area fall in lesser Himalayans range, at the project site hills are generally step and cover with forest area. The hill slope is cover with the boulders and mostly area not suitable for cultivation. Near the river both side cover with cultivation soil. The project site located across the river side at 95m and the width of river at the project site point the river is very narrow at the bed level.the is rocks exposed along both side the river at the project site location. The right slope of the river is about 500m for the project site.

Overall the project site has been proposed at left bank of the river for minimum use of land for construction of project site, so there is no non forest land and private land available for the construction of project. There is no alternative alignment available. Hence the project site purposed for construction fall in forest land.

Divisional Forest Officer.
