

SPECIFIC RECOMMENDATION

The proposed forest land for diversion was inspected on 18.12.2018. In majority of P.F's it was noticed that the soil is vulnerable to soil erosion, since the gas pipeline would be laid beneath the ground level and the area is vulnerable to soil erosion, soil conservation activities should be taken up along the pipeline. Moreover, since the gas is highly inflammable, all care and precaution should be taken to prevent blow out or leakage, so pipe of maximum permissible thickness should be used for gas pipeline. All the machinery and equipment should be transported only through the right of way proposed for diversion. Since, the project is mainly for providing energy security to the people living in the area the proposal may be accepted.
