

### Muck disposal Certificate

National hydrology project is a centrally sponsored scheme. This was launched for basically to collect the hydrological and metrological data from telemetry services to improve and expand hydrology data and information system, strengthen water resources operation and planning system and enhance institutional capacity for water resources management. The data will be received from different station. This will be placed at different location across the state. The system is an integration of electronic and software devices and collected data through telemetry services. Snow pillow is one the system among them, which is required to be installed at Sherethang. **During installation of this system there will be no generation of muck / earth** because it is a small system which will erect on the iron frame and fixed on the ground. Hence no need of disposal of muck is required.
