The Mining Lease of Tiringpahar Iron & Manganese mines of M/s Tata Steel Ltd, located within longitude E 85°-23'-00'' to 85°-25'-00'' and latitude N 21°-54'-00'' to 21°-57'-00'' in Survey of India topo sheet no. F45N5. The said lease executed over 169.00 ha comprises Khesera Forest (10.392 ha.), DLC Forest land (58.522 ha), Non-Forest land recorded as Forest as on 25.10.1980 (64.260 ha) and Non-Forest land (35.826ha.). The total forest land involved in the mining lease is 133.174 ha.

Forest land over 52.348 ha has been diverted under section- 2(ii) of FC Act, 1980 vide F. No. 8-80/2004-FC dated 28.03.2007 of MoEF, Govt. of India. The diverted forest land over 52.348 ha involves 11.650 ha Pre-1980 broken up DLC forest land and 40.698 ha (KF- 2.782 ha & DLC- 37.916 ha) of virgin forest land. The instant diversion proposal has been submitted over 80.826 ha. i.e 7.610 ha of Khesera Forest, 8.956 ha of DLC forest and 64.260 ha of Non-Forest land recorded as Forest as on 25.10.1980 in compliance with the guideline F No. 8-78/1996-FC(pt.) dt.10.03.2015 read with F No. 8-78/1996-FC(pt.) dt.09.03.2016 of MoEF&CC, Govt. of India.

A.2. Physiography and Geological formation

Tiringpahar Iron & Manganese mines of M/s Tata Steel Ltd, located within longitude E 85°-23'-00'' to 85°-25'-00'' and latitude N 21°-54'-00'' to 21°-57'-00'' in Survey of India topo sheet no. F45N5, consists of Khesera Forest, DLC Forest land and Non-Forest land recorded as Forest as on 25.10.1980. This site falls under the physiographic- Joda Barbil plateau extending from Chamakpur to the border of Singhbhum of Jharkhand in north and border of Bonai in the west. This region is an extension southwards of Singhbhum rocks. This group of rocks comprising trap, tuffites, shale, quartzite, phyllite, banded haematite jasper and banded haematite quartzite form high hill ranges with narrow deep valley. This region is characterised by massive deposit of iron and manganese are associated with B.H.J. and shales. The iron ores precipitates are in the form of oxide, carbonates, silicates and sulphides. The most characteristics feature of the iron ore i.e haematite is it's availability in the form of massive beds, pockets and large lensoid soil bodies. Hard massive, Laminated, Lateritoid & Blue dust are the major form of ore located in this physiographic zone.

Most characteristic feature of associated manganese ore is its occurrence in form of pocket, lenses in the shales of the iron ore group. It is also seen extensively as residual deposit. Manganese ore deposits are mostly confined to the Singhbhum-Bonai belt of Keonjhar district associated with BIF of Iron ore group. The ore minerals are chiefly pyrolusite and psilomelane. The important manganese deposits of the district are located at Roida, Sidhamatha, Bhadrasahi, Guruda, Joda, Harmath-Guali and Bamebari. The mineable reserve of Iron ore established so far is 239 Million Tonne of + 55 % Fe grade.

A.3. Floristic- Faunal Composition

The geological formation of this area is quite suitable for growth of Sal. Sal constitutes around 70 to 75% of the top canopy. The middle storey is un-conspicuous. The quality of Sal varies from all India Quality II to IV. Quality II Sal is mainly confined to the valleys while Q III occurs on the hill slopes of moderate gradient. Q IV Sal mainly confined in the ridges. Q I Sal is completely absent.

The principal associates of Sal includes *Terminalia alata*, *Lagerstroemia perviflora*, *Anogeissus latifolia*, *Terminalia belerica*, *Syzygium cumini*, *Mangifera indica*, *Schleichera oleosa*, *Adina cordifolia*, *Pterocarpus marsupium*, *Bombax ceiba*, *Bridelia retusa*, *Madhuca indica*. The middle story is represented by *Syzygium cumini*, *Ougeinia ougenensis*, *Careya arborea*, *Treema orientalis*, *Embllica officinalis*, *Cassia fistula* etc. The

shrubs and undergrowth are characterized by *Indigofera pulchella*, *Ardisia solanacea*, *Flemingia chhappar*, *Helicteres ixora* and *Clerodendron viscosum* etc. The prevailing climbers include *Bauhinia vahlii*, *Combretum decandrum* and *Beutia parviflora*. The grasses over the forest floor include *Chrysopogon aciculatus*, *Imperata cylindrica*, *Dicanthium cariccosum*, *Cynodon dactylon* etc.

The canopy density of the prevailing forest growth is situated nearer to the Baitarani Reserve Forest varies from 0.2 to 0.8. The prevalence of pole crop to middle aged sal crop in this area indicates the shifting cultivation in the past and the crop can therefore be considered to be secondary origin. But the secondary moist deciduous forest replacing primary forest of the same type is not differentiated as almost all the primary forests have been practically influenced by human interference. The prevailing forest growth & structure of the forest crop in the proposed non-forest land recorded as forest is categorised as "Open mixed Jungle mainly Sal" with canopy density 0.3.

The Baitarani Reserved Forest and the adjoining Revenue Forest and DLC Forest land along with the Non-Forest land recorded as Forest is the dwelling habitat for Bear, Barking Dear, Hyena, Porcupine and etc. Movement of wild Elephants is often witnessed in Baitarani Reserved Forest and adjoining Forest land. The applied site falls under Elephant habitat zone- 2 as mentioned by ORSAC, Bhubaneswar.

The Mining Lease contains total mineable reserve of 0.730 million tonnes of Manganese Ore. The annual production capacity is 0.85 LTA manganese ore. This project will generate direct and indirect employment for more than 1050 and 500 person respectively.
