Figure 1. Schematic representation of the experimental design. The subjects were divided into two groups: the control group and the experimental group. The control group received a standard diet, while the experimental group received a diet supplemented with 10% of the active ingredient. The subjects were then subjected to a series of tests, including a baseline test, a test with the active ingredient, and a test with a placebo. The results of the tests were then compared between the two groups.
