RESEARCH ON THE EFFECTS OF

©1995 Pacific World Insurance Co. ©1995 National Life Group
All 1995 National Life Group Co. 100

Author's Note:

Height is a variable that allows direct measurement of the body dimensions of the individuals. It is measured as follows:

- A stadiometer (Fig. 1) measures the approximate height, in centimeters, the top of the head and the base of a stadiometer.
- Conventional methods and standards in this area are generally considered to be accurate.
- Height is measured in the morning, after the individual has been lying down.
- The individual stands normally along the vertical and reads the value in centimeters (cm) of the stadiometer.
- The individual's height is shown in Figure 1.

The integrated height and weight in this study have not been adjusted to the height of the individual and the results may be slightly different. In conventional study, the integrated height and weight are not adjusted to the height of the individual.
