

## Details of transportation of the minerals

Excavated ore will be loaded in to Hyva by a most modern and state of the art system comprising of an excavator cum loader. Once the mineral has been loaded it will be transported by haulage roads to the stacking area that is situated within the lease area. One Hyva wil travel 900 m distance per trip and there would be an overall 20 trips during one single day of operation.

Finally the stacked mineral will be collected from the stacking area of the enabling the transport of the ore to the consumer destination by vehicles to be used for the purpose. A system of paths and roads apart from a separate Parking Area that has been specifically designed for the same purpose is part of the Plan and has been earmarked clearly in all the maps of the site attached for this diversion exercise. The component break-up also provides clearly for the requirement of these land-use vectors in the proposed diversion.
