It should be noted, e.g., that the maximum length is 100 mm, between the tip and base of a closed fin.

Why have international definitions of fin length been chosen that are called "fin length" and that depend on the shape of the fin boundary system?

The length of some fish varies from the end to the end of the body (total length) and is measured from the snout to the tail.

There is a lot of variation in the way that fin length is measured from the snout to the tail.

There is a lot of variation in the way that fin length is measured from the snout to the tail.

COMPLETION INDEX

☐ a. Completed from full-time nursing student; required to complete within 30 days.

Maximally Variation from True Body about 1 Year is 20%.
