1. **Identify the problem.** The first step is to identify the problem. This involves understanding the symptoms and the context in which they are occurring.

2. **Define the problem.** Once the problem is identified, it needs to be defined in terms of specific, measurable, achievable, relevant, and time-bound (SMART) objectives.

3. **Generate solutions.** The next step is to generate potential solutions. This involves brainstorming and considering different perspectives.

4. **Evaluate solutions.** Each potential solution should be evaluated based on its feasibility, effectiveness, and potential risks.

5. **Select a solution.** After evaluating the solutions, a decision should be made on which one to implement.

6. **Implement the solution.** The chosen solution should be implemented in a structured and systematic manner.

7. **Monitor and evaluate.** The implementation should be monitored and evaluated to ensure it is effective and to make any necessary adjustments.

Figure 1. Schematic diagram of the experimental setup. The subject is seated in a chair and views the screen through a mirror. The screen displays the target (a red dot) and the starting position (a green dot). The subject's hand is positioned at the starting position. The distance between the starting position and the target is 10 cm. The subject is instructed to move the hand from the starting position to the target. The movement is recorded by a video camera. The data are analyzed using a computer program.
