

## **COST BENEFIT ANALYSIS**

The project “**Removal of blind corner and straightening of approach road at Mongjam**” is required in order to make a safety corner for the approach IVR (Inter Village Road). This will make the people living in the area safe and better access to the road. In addition to this, it will lower the maintenance cost of the road and it will also improve mobilization of the people and goods. The new road to be constructed will be cost effective and it will reduce fuel consumption and maintenance cost of Rs. 1.5-2.5 lakh annually in the future. The project is likely to generate 50 (approx..) temporary employees. The project will further provide an open space of 0.20 ha for parking, public gathering/meeting, bus stand, local vegetable market (temporary), etc. Social and financial development will enhance in the area.
