

3D Subsidence Analysis Report

Kharsang Oil Field is under production for the approximately last 32 years and till date no surface subsidence has been noted within the field area. Oil and Gas production involves extraction of the pressurised fluids (oil/gas) from the subsurface reservoir sands, which in case of Kharsang generally lies from 500 to 1500 m below ground level; therefore not affecting the surface rock integrity.

Keeping in mind of the above, 3D subsidence Analysis report is not essentially required, at present, for the Kharsang Field.
