MANUFACTURING PROCESS

Raw Cotton in the form of pressed bales is procured from ginner and stored in godowns. From godown it is shifted to Blow Room for cleaning of contaminants and foreign material. Material of Blow room is fed to carding through pipeline with the help of ventilators for further cleaning and individualization of fibers. Output material from card is accumulated inside the cans fitted with castors for transportation. Material from carding is fed to breaker draw frame & then to lap former for combing process. Laps from lap former are fed to comber for further cleaning and removal of short fibers. Material of comber is then fed to Finisher Draw Frame in order to increase uniformity & attenuation of fibers. In case of carded process Breaker Draw Frame Output material is directly fed to finisher Draw Frame bypassing Lap former and Comber. Finisher Draw frame material is now fed to Speed frame. In speed frame, sliver is drawn & twisted to form roving which is wound into bobbins. Such small packages of bobbins from speed Frame are fed to Ring Frame where finally yarn is prepared. This yarn is then run in the Autoconers to make objectionable fault free & convert the yarn into package form on small cones. Yarn in cone form is fed to YCP for twist setting and addition of moisture to yarn which leads to higher strength of yarn. Conditioned yarn cones are then packed in cartons, pallets or HDPE bags and send to the godowns for final dispatch to Customer.
